(Algebra 2) - Mathplanet

Example. $2, 4, 6, 8, 10, \dots$ is an arithmetic sequence with the common difference 2. If the first term of an arithmetic sequence is a_1 and the common difference is d , then the n th term of the sequence is given by: $a_n = a_1 + (n - 1)d$. An arithmetic series is the sum of an arithmetic sequence. We find the sum by adding the first, a_1 and last

So when we add up a portion of the sequence we just get what is called a partial sum, okay? So we're just adding up sum of the terms in the sequence. And we actually have a formula for the sum of an arithmetic sequence. And how it works is s of n , so this is the sum of the first n terms in this series is equal to n over 2.
