Understand shutter speeds, lens openings, focusing, and zoom lenses--and how to use each of these features as creative tools.

A 2009 G20 official document stated that the era of banking secrecy is over but is it? If banking secrecy is the result of market mechanisms, it suggests that worldwide demand and supply are likely to remain for a long time to come. Since the Global Financial Crisis, many countries have fought to combat banking secrecy, yet it permeates both national and international industries, and global efforts to prevent banking secrecy have been ineffective or at worst counterproductive. In this book, the authors show how the growth of criminal activity has systematically generated a demand for banking secrecy. They explore how national politicians and international banks have been motivated to supply banking secrecy through economic and political incentives, and shed light on the economics and politics of banking secrecy. This book takes a multidisciplinary approach to reveal the variety of behaviours and processes involved in making dirty money appear clean, providing an in-depth study of financial transactions which are characterized by a special purpose: hiding the originally illegal sources. This work will be of interest to students and scholars of economics and finance, and those with an interest in banking secrecy, global finance, international banking, and financial regulation.

Very light, very strong, extremely reliable -aircraft and aerospace engineers are. and have to be. very demanding partners in the materials community. The results of their research and development work is not only crucial for one special area of applications, but can also lead the way to new solutions in many other areas of advanced technology. Springer-Verlag and the undersigned editor are pleased to present in this volume, an overview of the many facets of materials science and technology which have been the objective of intensive and systematic research work during past decades in the laboratories of the German Aerospace Research Establishment. Its contents shows clearly the interrelations between goals defined by the user, fundamentals provided by the scientists and viable solutions developed by the practical engineer. The particular personal touch which has been given to this volume by its authors in dedicating it as a farewell present to Professor Wolfgang Bunk, inspiring sci entist and director of the DLR Intitute of Materials Research for more than 20 years, has obviously given an added value to this important publication. Surely, this truly cooperative endeavour will render a valuable service to a large interna tional community of interested readers, many of them having personal links to the Institute. its director and its staff.

This volume teaches calculus in thebiologycontextwithoutcompromising the level of regular calculus. The material is organized in the standard way and explains how the different concepts are logically related. Each new concept is typically introduced with a biological example; the concept is then developedwithoutthe biological context and then the concept is tied into additional biological examples. This allows readers to first seewhy a certain concept is important, then lets them focus on how to use the conceptswithoutgetting distracted by applications, and then, once readers feel more comfortable with the concepts, it revisits the biological applications to make sure that they canapplythe concepts. The book features exceptionally detailed, step-by-step, worked-out examples and a variety of problems, including an unusually large number of word problems.The volume begins with a preview and review and moves into discrete time models, sequences, and difference equations, limits and continuity, differentiation, applications of differentiation, integration techniques and computational methods, differential equations, linear algebra and analytic geometry, multivariable calculus, systems of differential equations and probability and statistics.For faculty and postdocs in biology departments.

On the long roads of Deverry ride two mercenaries whose fates like hidden deep in that of their own land. But Lord Rhodry, exiled from the dragon court of Aberwyn, has yet to discover his true parentage, and his swordmaster-lover, Jill, has barely glimpsed her awesome powers. Meanwhile, the ancient sorcerer Nevyn, held back by his vows from boldly intervening in their lives, can only watch and wait as Rhodry and Jill move ever closer to danger. For as the two struggle to recover the Great Stone, the mystic jewel that guides the conscience of the kingship of Deverry, malevolent dark masters are weaving terrifying spells against them--and displacing messengers of death. Katharine Kerr has extensively rewritten DarksPELL, incorporating major changes in the text, making this her definitive edition. Here the epic saga that began with the Daggerepell continues--a tale of might and magic, lust and glory, dark danger and poignant desires that echo from Deverry's sapphire waters to its secret mountain caverns. It's a spellbinding story destined to please fantasy lovers everywhere.

A companion series to our "Competitive Mathematics for Gifted Students," the series "Math Challenges for Gifted Students" offers additional material in practice test form. The workbooks are useful for assessment and for development of testing skills. In full color and with fully detailed solutions, the workbooks may be used as a fun introduction to competitive problem solving. However, the problems are a bit more difficult than actual Kangaroo problems, exploring a large number of known 'tips and tricks.' One could say it is much more concentrated in that, unlike actual exams, it has less 'filler' - almost every problem is 'tricky' and embodies a specific strategy. The material is excellent for training purposes and has been used by the authors in seminars with hundreds of the most gifted students in the Bay Area. The workbook contains six 24-question tests. After each test there is an answer key. The tests are followed by detailed solutions. The recommended time limit for each test is of 75 minutes. Students who have not been exposed to competitive problem solving will find this book extremely difficult and will need help from an adult. Without preparation, students who get 'A' in school generally score about 50 points out of 96 possible on Kangaroo level 1-2.

This book covers the material required for a basic understanding of chemical reaction engineering. Such material would normally be taught in a first chemical reaction engineering course in a university chemical engineering department. The principles of reaction engineering are simply and clearly presented; simple illustrative problems are used to demonstrate how these principles are practically applied. Further problems, with solutions, based on exam questions, are supplied. The books written in a way that it could be used as a self-study guide and would be useful for undergraduate chemical engineers early in their degree as well as engineers and scientists of other disciplines interested in acquiring some knowledge of reaction engineering outside of a formal teaching environment.
