Assembled here for the first time in one volume are forty classic papers that have laid the foundations of modern ecology. Whether by posing new problems, demonstrating important effects, or stimulating new research, these papers have made substantial contributions to an understanding of ecological processes, and they continue to influence the field today. The papers span nearly nine decades of ecological research, from 1887 on, and are organized in six sections: foundational papers, theoretical advances, synthetic statements, methodological developments, field studies, and ecological experiments. Selections range from Connell's elegant account of experiments with barnacles to Watt's encyclopedic natural history, from a visionary exposition by Grinnell of the concept of niche to a seminal essay by Hutchinson on diversity. Six original essays by contemporary ecologists and a historian of ecology place the selections in context and discuss their continued relevance to current research. This combination of classic papers and fresh commentaries makes Foundations of Ecology both a convenient reference to papers often cited today and an essential guide to the intellectual and conceptual roots of the field. Published with the Ecological Society of America.

R. K. Peet Dep. of Botany, University of North Carolina, Chapel Hill, N. C. 27514, USA Robert Whittaker's contributions to ecology were many and remarkably varied. His publication record will long stand as a monument to his greatness, and whatever we do to honor him will likely be rather small in comparison. Less well known were his personal interactions and the impact they had on the development of ecology as well as individual scientists. Over the years he touched many of us and we felt not just a professional but also a deep personal loss in his passing. After his death I was contacted by numerous colleagues who wondered what they might do to honor him. Whittaker had long served on the editorial board of Vegetatio, which prompted Eddy van der Maarel to suggest that a series of papers in the journal might be a fitting memorial, and so this project was conceived. Whittaker was a master of synthesis and during his career he published numerous review papers which showed clearly how his work related to and built on that of others. For this reason it seemed inappropriate and redundant to solicit papers reviewing areas to which Whittaker made important contributions. Instead, I chose to solicit research papers illustrating current applications of approaches Whittaker developed and showing a few of the recent advances which have grown directly from his pioneering work.

The editors begin with articles that illuminate the discipline's diverse scientific foundations, such as L.

Case studies focus on applications of artificial neural networks, genetic algorithms, fuzzy logic and adaptive agents to current ecological management issues such as toxic algal blooms, eutrophication, habitat degradation, conservation of biodiversity and sustainable fishery.

How do poems and novels create a sense of mind? What does literary criticism say in conversation with other disciplines that addresses problems of consciousness? In *Paper Minds*, Jonathan Kramnick takes up these vital questions, exploring the relations between mind and environment, the literary forms that uncover such associations, and the various fields of study that work to illuminate them. Opening with a discussion of how literary scholarship's particular methods can both complement and remain in tension with corresponding methods particular to the sciences, *Paper Minds* then turns to a series of sharply defined case studies. Ranging from eighteenth-century poetry and haptic theories of vision, to fiction and contemporary problems of consciousness, to landscapes in which all matter is sentient, to cognitive science and the rise of the novel, Kramnick's essays are united by a central thematic authority. This unified approach of these essays shows us what distinctive knowledge that literary texts and literary criticism can contribute to discussions of perceptual consciousness, created and natural environments, and skilled engagements with the world.
