According to the book, Feedback Control is a topic well known to mechanical engineers, but not so much in the software industry. Feedback Control is about making smarter systems that can cope with dynamic environments. Many knobs that developers build into configuration can actually be automated with feedback loops. Examples given early in the book:

Feedback Control for Computer Systems by Philipp K. Janert ...

Feedback Control for Computer Systems by Philipp K. Janert was both absolutely amazing and slightly disappointing at the same time. The book is about application of control theory (mostly using PID controllers) to computer systems and is divided into four parts (and an appendix).

The following fact seems to be largely ignored: Feedback control is playing an increasing r ô le for computer systems. Philipp K. Janert intends to explain to computer scientists feedback control, and especially PID (proportional-integral-derivative) controllers, i.e. the far most popular industrial feedback loop.

Feedback Control For Computer Systems  
Feedback controls are widely used in modern automated systems. A feedback control system consists of five basic components: (1) input, (2) process being controlled, (3) output, (4) sensing elements, and (5) controller and actuating devices. These five components are illustrated in Figure 1.

## Preface - Feedback Control for Computer Systems [Book]

One advantage of computer systems, digital control whose variable values are changed discretely only when the controller decides so, is also one of the problems.

## Book review: Feedback control for computer systems - DZone ...

A system with feedback and control functions is sometimes called a cybernetic system, that is, a self-monitoring, self-regulating system. • Feedback is data about the performance of a system. For example, data about sales performance are feedback to a sales manager.

What is feedback in a control system? -

Quora

Feedback occurs when outputs of a system are routed back as inputs as part of a chain of cause-and-effect that forms a circuit or loop. The system can then be said to feed back into itself. The notion of cause-and-effect has to be handled carefully when applied to feedback systems: Simple causal reasoning about a feedback system is difficult because the first system influences the second and ...

Feedback - Wikipedia

Feedback loops Control systems can be open loop or closed loop. Open loop systems will just consider the input and then keep repeating the same task given the input, e.g. a microwave heats for a given time period without actually checking the temperature of the food.
