Prior to the military conflicts in Iraq and Afghanistan, wars and conflicts have been characterized by such injuries as infectious diseases and catastrophic gunshot wounds. However, the signature injuries sustained by United States military personnel in these most recent conflicts are blast wounds and the psychiatric consequences to combat, particularly posttraumatic stress disorder (PTSD), which affects an estimated 13 to 20 percent of U.S. service members who have fought in Iraq or Afghanistan since 2001. PTSD is triggered by a specific traumatic event - including combat - which leads to symptoms such as persistent re-experiencing of the event; emotional numbing or avoidance of thoughts, feelings, conversations, or places associated with the trauma; and hyperarousal, such as exaggerated startle responses or difficulty concentrating. As the U.S. reduces its military involvement in the Middle East, the Departments of Defense (DoD) and Veterans Affairs (VA) anticipate that increasing numbers of returning veterans will need PTSD services. As a result, Congress asked the DoD, in consultation with the VA, to sponsor an IOM study to assess both departments' PTSD treatment programs and services. Treatment for Posttraumatic Stress Disorder in Military and Veteran Populations: Initial Assessment is the first of two mandated reports examines some of the available programs to prevent, diagnose, treat, and rehabilitate those who have PTSD and encourages further research that can help to improve PTSD care.

A Vietnam veteran and career veterans' counselor who struggles with post-traumatic stress (PTS) tells how to recognize the symptoms of PTS and how to begin the healing process. The veteran and those who care about him/her must understand that: - he/she is not alone in this struggle - and that he/she is not crazy. Post-traumatic stress is a sane person's reaction to intense or protracted violence. We learn to control the anxiety, hypervigilance and behaviors that tend to interfere with making a living, studying and social functioning. Making peace with post-traumatic stress means understanding the nature of the beast that followed you home, and knowing what triggers PTS symptoms in you. Making peace means seeking help from Department of Veterans Affairs caregivers who will give you the tools to deal with PTS. The author tells you what to expect from VA Vet Centers, VA Mental Health Clinics, and the trained people who are there to help you. Additionally, we find that we must make peace with those who love us, with the buddies we left behind, and even with ourselves. The author gives personal insights into these issues. He also draws from personal experience to give practical advice to younger veterans on job searches, education, family financial management, and the veteran's role in the American political process. Although money is not a cure for post-traumatic stress, the author walks you through the process of claiming PTS (and other conditions) as VA-recognized disabilities for VA compensation. Examples of stressor statement forms that resulted in successful compensation claims are provided. For Vietnam veterans, an appendix provides information on Agent Orange claims.

Indigenous Peoples around the world and our allies often reflect on the many challenges that continue to confront us, the reasons behind health, economic, and social disparities, and the best ways forward to a healthy future. This book draws on theoretical, conceptual, and evidence-based scholarship as well as interviews with scholars immersed in Indigenous wellbeing, to examine contemporary issues for Native Americans. It includes reflections on resilience as well as disparities. In recent decades, there has been increasing attention on how trauma, both historical and contemporary, shapes the lives of Native Americans. Indigenous scholars urge recognition of historical trauma as a framework for understanding contemporary health and social disparities. Accordingly, this book uses a trauma-informed lens to examine Native American issues with the understanding that even when not specifically seeking to address trauma directly, it is useful to understand that trauma is a common experience that can shape many aspects of life. Scholarship on trauma and trauma-informed care is integrated with scholarship on historical trauma, providing a framework for examining contemporary issues for Native American populations. It should be considered essential reading for all human service professionals working with Native American clients, as well as a core text for Native American studies and classes on trauma or diversity more generally.

From the author of *The Veteran's Survival Guide*, *The Veteran's PTSD Handbook* addresses the obstacles that veterans face when filing for benefits related to post-traumatic stress disorder (PTSD). One of the greatest obstacles, John Roche writes, is establishing a connection between a veteran's service and PTSD. Because both combat stressors and noncombat stressors can cause PTSD and because of the difficulties in diagnosing the condition, filing a successful claim for benefits based on PTSD is difficult. In the same accessible, self-help style used in *The Veteran's Survival Guide*, Roche offers detailed instructions on how to prepare a well-grounded claim for veterans' benefits relating to PTSD. He also discusses the four years he spent helping one veteran establish a "service connection" for his PTSD claim with Veterans Affairs. This book will be required reading for any veteran or veteran's dependent who wishes to obtain his or her well-earned benefits and for those officials of veterans' service organizations who assist veterans with their claims.

With the rise of school shootings and the recent March for Our Lives movement, *Urban Youth Trauma* focuses on the timely and important topic of urban violence and guns, while also addressing intervention strategies for social workers and counselors.

Based on the 103rd annual meeting of the American Psychopathological Association, *Long-Term Outcomes in Psychopathology Research: Rethinking the Scientific Agenda* explores the long-term course of illness and functioning of individuals treated for mental health and substance use disorders and the outcomes research derived from these cases. Sections cover topics including: findings from long-term psychopathology outcome studies, problematic case definitions, differing perspectives on the concept of recovery, the need for continued long-term outcomes research, and research priorities for patients with chronic and severe disorders. The book employs the experiences of innovative mental health providers, reflecting the value of personal narratives in research conducted in cross-sectional increments with pre-formulated questions and response options. As psychiatry continues to refine its diagnostic categories and psychology demands greater attention to dimensionality, the need for interdisciplinary long-term studies is as critical as ever. This final volume in the American Psychopathological Association Series reflects on developments in outcomes research conducted in parallel with different disorders and offers suggestions for preserving long-term outcome studies as the mainstay of clinical knowledge.

Advances in trauma care have accelerated over the past decade, spurred by the significant burden of injury from the wars in Afghanistan and Iraq. Between 2005 and 2013, the case fatality rate for United States service members injured in Afghanistan decreased by nearly 50 percent, despite an increase in the severity of injury among U.S. troops during the same period of time. But as the war in Afghanistan ends, knowledge and advances in trauma care developed by the Department of Defense (DoD) over the past decade from experiences in Afghanistan and Iraq may be lost. This would have implications for the quality of trauma care both within the DoD and in the civilian setting, where adoption of military advances in trauma care has become increasingly common and necessary to improve the response to multiple civilian casualty events. Intentional steps to codify and harvest the lessons learned within the military's trauma system are needed to ensure a ready military medical force for future combat and to prevent death from survivable injuries in both military and civilian systems. This will require partnership across military and civilian sectors and a sustained commitment from trauma system leaders at all levels to assure that the necessary knowledge and tools are not lost. A National Trauma Care System defines the components of a learning health system necessary to enable continued improvement in trauma care in both the civilian and the military sectors. This report provides recommendations to ensure that lessons learned over the past decade from the military's experiences in Afghanistan and Iraq are sustained and built upon for future combat operations and translated into the U.S. civilian system.
